ABSTRACT

To meet its responsibilities under the global Paris Agreement, the European Union has set ambitious climate targets of becoming climate neutral by 2050. To do this, every sector in Europe must play a role in reducing carbon dioxide emissions. Whilst there has been recent acknowledgement that, to regain some of the competitiveness lost in the EU in recent years, there may need to be an easing of the burden on industry, the EU is committed to 'staying the course' on its climate goals.

The European chlor-alkali industry will also have to play its role here and this presentation will set the scene on what the expectations are, where we are today and what will be needed in future to ensure that we can meet our responsibilities here.
